Displacements

due to

Shear

by

Virtual Work

N. Hottz

Nov. 2012

Revision History:

1. Nov. 13, 2012 - original posting.

VW Relationship:

$$\underbrace{1 \cdot \Delta}_{\text{external work (virtual)}} = \underbrace{\sum v dL}_{\text{strain energy (virtual)}}$$

Strain Energy - Transverse Shear

$$\gamma = \frac{\tau}{G}$$

τ = avg. shear stress across cross-section

$$\tau \approx k \left(\frac{V}{A} \right)$$

V - applied shear force

A - cross-sect. area

k - form factor

1.2 rect. x-sect

≈ 1.0 for WF

(A = hw of web)

$$\text{element strain energy} = v \gamma dx$$

$$= v \frac{k \left(\frac{V}{A} \right)}{G} dx$$

$$= k \frac{vV}{GA} dx$$

$$\text{total shear s.e.} = \int_{\text{length}} k \frac{vV}{GA} dx$$

Beam

W360x33

$I = 82.6 \times 10^6 \text{ mm}^4$
 $A_w = 332 \times 5.8 = 1930 \text{ mm}^2$ $k = 1.0$
 $E = 200\,000 \text{ MPa}$
 $G = 77\,000 \text{ MPa}$

Defln due to bending

$$1 \times \Delta_b = \frac{2}{EI} \int \left(\begin{array}{c} 1500 \\ 3000 \end{array} \right) \left(\begin{array}{c} 165 \times 10^6 \\ 3000 \end{array} \right) \quad (\text{units of } N, \text{mm})$$

$$= \frac{2}{200\,000 \times 82.6 \times 10^6} \times \frac{3000}{3} \times 1500 \times 165 \times 10^6$$

$$= 89.9 \text{ mm}$$

Defln due to shear

$$1 \times \Delta_s = 2 \times \frac{k}{GA} \int \left(\begin{array}{c} 0.5 \\ 3000 \end{array} \right) \left(\begin{array}{c} 55000 \\ 3000 \end{array} \right)$$

$$= 2 \times \frac{1}{77\,000 \times 1930} \times 3000 \times 0.5 \times 55\,000$$

$$= 1.1 \text{ mm}$$

$$\text{Total Defln} = 89.9 + 1.1 = 91.0 \text{ mm}$$

(1.2% due to shear)
 (usually negligible in most structures)

S.E Torsion

Circular Shafts

Total S.E. in shaft:

$$U_t = \frac{tTL}{GJ}$$

$$J = \text{polar moment of inertia} = \frac{\pi r^4}{2}$$

SummaryVirtual
S.E.

axial loads

$$\frac{nNL}{AE}$$

torsion
(circular shaft)

$$\frac{tTL}{GJ}$$

beam (flexure)

$$\int_{\text{length}} \frac{mM}{EI} dx$$

beam (shear)

$$\int_{\text{length}} k \frac{vV}{GA} dx$$

$$(k = \text{form factor})$$

$$1.0 \leq k \leq 1.2$$

These effects must be combined where appropriate, in the right side of

$$1(\Delta) = \sum u dL$$

$$= \sum \text{strain energy (virtual)}$$

Chapter 9 (in text)

differential temp (p 372) not covered
(though temp changes in trusses is)

9-7 Castigliano's Theorem - not covered.
